**How does a burn happen?** When skin comes in contact with temperature above 40°C, from exposure to hot fluids/liquids, steam etc., protein denaturation takes place due to which its plasma membrane integrity is lost and burns are caused. When temperature is higher than 60°C, this process speeds up and takes only a little time. Higher temperature and prolonged contact cause deeper burns. The skin releases fluids to form a barrier to save the inner cells, thus forming blisters. What should you do?

Apply **FLORELS BURNSHIELD OIL** with common salt immediately. This revolutionary product will give you fast relief from pain and obstruct blister formation in case of 1<sup>st</sup> degree burns. Act fast as even a second's delay matters.

**How does Florels Burnshield Oil help you?** It will penetrate deep into the skin and regain the plasma membrane integrity and the salt will remove the fluids by way of osmosis. Apply salt lavishly and add oil again and again, if needed. The nerve cells will be soothed and the pain will disappear after a while. Wait for at least half an hour before you resume your work. Don't wet with water.

Thus your smart work with Florels Burnshield Oil can keep 1<sup>st</sup> degree kitchen burns at bay.
